4. Local Data-Based EMG Findings

■ Signal Reasoning (Quantitative Text Analysis):

- * Rehab score: 69/100. Signal quality: Good.
- * Symmetry: 68.0% with 32.0% deficit. Marked left-side deficit detected.
- * Weakest muscle/channel: Channel 2. Strongest peak: Channel 4.
- * Fatigue: Low (0.0% drop from early to recent activity).
- * Within-side pair balance: left pair 63%; right pair 53%.
- * Suggested focus: compare the two right-side muscles/channels and train the weaker activation pattern.
- * Selected affected side: Select Affected Side. Non-diagnostic rehab monitoring support only.

Recorded Session Findings:

- * Recording summary: 8730 EMG samples captured over approximately 60 seconds.
- * Overall rehab score: 69/100. Signal quality: Good.
- * Bilateral symmetry: 67.8% with 32.2% deficit. Impression: marked left-side activation deficit. Bilateral EMG symmetry is reduced and requires targeted rehab attention.
- * Weakest muscle/channel: Channel 2 showed the lowest average activation (0.6).
- * Strongest contraction: Channel 1 showed the highest peak activation (5.3).
- * Within-side pair balance: left pair 67.1%; right pair 55.7%.
- * Fatigue/endurance: Low fatigue pattern with 4.0% drop from early to recent activity.
- * Sustained activation: Channel 1 0.0%, Channel 2 0.0%, Channel 3 0.0%, Channel 4 0.0% above threshold.
- * Clinical note: Affected side was not selected; interpretation is limited to channel activity and symmetry. This is a non-diagnostic rehab monitoring prototype that provides quantitative EMG feedback for physiotherapy support.
